#### 1. Introduction

Sexual assault is far too common, effecting both men and women. It is reported that one in three women have been the victim of rape or attempted rape (Hope Alliance 2018). Sexual assault on women has become so prevalent that a majority of them admit to taking regular steps to avoid being sexually assaulted including always having their phone with them when preparing to walk alone (Mental Health America 2018).

Unfortunately, it is also common that sexual assaults go unreported. Only around one in five rapes are ever reported (Hope Alliance 2018). Not only is there a lack of education in regards to how to report rape or sexual assault, there is also a lack of education on what rape or assault even is. In addition to not knowing if what happened to them is considered rape or sexual assault, women often have to deal with other barriers including confusion, fear of judgment, and perceived lack of evidence (Amnesty International 2019).

These two elements couple to create a negative cycle amongst women and assault victims. Women live in fear of being assaulted, and if they are assaulted, the assailant is not held accountable. This means that a woman's mental health can be negatively affected, while their assailant is free to continue to victimize others.

Care Corner is a tool that is meant to serve as an aid to reduce the frequency of these assaults, build an appropriate confidence in women as a travel alone, and increase the frequency of reporting attacks, so guilty parties are held accountable. Care Corner offers preventive measures, such as a panic button to notify friends of emergencies, and a fake phone call feature to excuse yourself from uncomfortable situations. Care Corner also looks to assist those who have been assaulted by offering local and national resources to aid and assist with the reporting process.

### 2. Care Corner Product Description

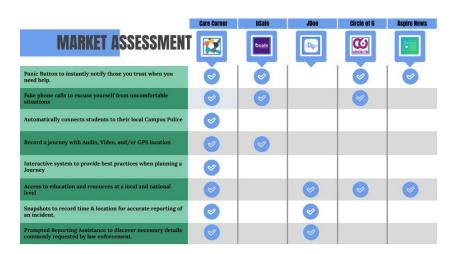

Care Corner is a mobile app, for both Android and iOS, meant to aid anyone who feels they are at risk of being assaulted. The application consists of two main areas which are prevention and reporting.

Care Corner offers several options to assist in the prevention of assault. This extends from making sure your friends and family are aware of your location, to planning your night accordingly to maximize your safety.

Care Corner also looks to educate it's users and ensure if an assault does occur that the user has all the necessary tools needed to properly report any assailants. In addition, Care Corner also looks to assist users with recovery by connecting them with local and national aid.

Figure 1

Care Corner Market Assessment

A review of the market in a similar space revealed that there are other applications which look to either aid in prevention or education on the subject of assault. However, none of which cover this subject as completely, and with as many options, as Care Corner. Care Corner offers

features for safety including tracked walks, and panic buttons. Care Corner also offers assistance with reporting an assault, and safety tips.

## 2.1 Key Product Features and Capabilities

Care Corner offers multiple solutions to aid in the safety of its users. The first of which is the Armed Journey Mode. In this mode the user's location and destination can be sent to select contacts in order to ensure friends and family are aware of the user's location. The users have complete control over which contacts receive what information.

Care Corner also features a Fake Phone Call feature. This can be pre-programmed to occur at a specified time or can be activated to use in real time. This feature is used by the user when excusing themselves from uncomfortable situations. It also puts the phone in a more alert state in case an emergency happens.

While the phone is in Armed Journey mode, or in a Fake Phone Call, the Panic Button feature can be activated. The Panic Button feature is used if the caller feels as though they are in any imminent danger. The user can pre-set what the activation of the Panic Button does.

Activating the Panic Button can result in messaging pre-selected contacts, sending GPS location to pre-selected contacts, recording audio video or GPS location, noting the time and GPS location of the activation of the button, and offering emergency services contact information such as 911 or campus police.

Care Corner also looks to educate its users so that they can make more informed decisions, and have direction in case an assault takes place. Care Corner offers a Mombot feature, which the user can verbally state that plans for the evening, and receive some safety practice in return. Mombot also issues a battery warning so the user may be reminded to charge their phone before starting their journey. Mombot also connects users to a plethora of resources,

both local and national, that can assist with everything from locating a local shelter, to reporting and education.

In the case of an assault, Care Corner assists with the reporting process. First, when the Panic Button is activated, the GPS location and time will be noted. This is instrumental in reporting exactly where and when and assault took place. Care Corner also prompts the user to note relevant information quickly before the important details become lost in a user's memory.

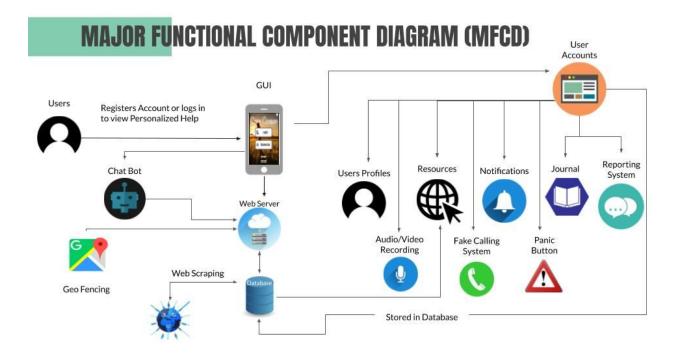

### 2.2 Major Components (Hardware/Software)

Care Corner is a mobile application, so the first required component to use if is a cell phone. Care Corner is on both Android and iOS platforms. Care Corner's server infrastructure will be supported entirely through Amazon Web Services(AWS.) The web server for the Care Corner site is provided through the AWS-S3 web service. The database server runs on AWS-RDS servers using MySQL. The file server is also hosted through the AWS-S3 service.

The Care Corner website, which serves as an information landing point about the app, is constructed using a combination of HTML, CSS, JS, and PHP. The development of the app takes place primarily within the Windows operating system. The Care Corner team utilizes GitLab for development and software control. Gradle is used as the primary build management tool, and the organization regarding the development of the app is also done in GitLab.

Figure 1

Care Corner M<ajor Functional Component Diagram

Care Corner also relies on external dependencies and APIs. The user's GPS location is used in conjunction with the Google Maps API to geofence local resources for the user. Twilio service is used to message users contacts in case a journey is started, or the panic button is activated. Care Corner utilizes web scraping and RSS feeds to gather resource information and educational information for the users

#### 3. Identification of Case Study

Care Corner was designed with the safety of women in mind because the issue of sexual assault affects them at a higher rate than men. However, Care Corner is not designed for only women, instead it can be used by anyone who feels the need to take additional precautions in regards to their safety. The features offered with Care Corner directly impact it's users but,

indirectly have a positive impact on the user's friends and family. As the user is safer and more open about their safety, the comfort of their friends and family is increased as well.

Since care corner is a tool to aid in the fight against assault, it can be used by professionals in related fields as another tool for their clients. This means entities like health organizations, law enforcement, and emergency response worker can offer this to those in need to assist.

- 4. Care Corner Product Prototype Description
- 4.1 Prototype Architecture (Hardware/Software)
  - 4.2 Prototype Features and Capabilities
  - 4.3 Prototype Development Challenges

#### 5. Glossary

**Agile**: Set of frameworks and practices where solutions evolve through collaboration between self-organizing cross-functional teams

Amazon Web Services (AWS): Cloud computing platform provided by Amazon

**Android**: Mobile operating system primarily developed by Google

**API (Application Programming Interface)**: A set of functions that allow one program to access data and interact with an external program

**Client-server**: Computer system where a central server provides data to a number of networked workstations

**Cloud Based Database Server**: Virtual infrastructure that performs application and information-processing storage

**Data Retention**: Storage of an organization's data for compliance or business reasons

**Database**: Structured data held in a computer

File Server: Controls access to separately stored files

**Geofencing**: Using GPS to create a virtual geographic boundary

**GitHub**: Web-based collaboration platform for software developers

GPS (Global Positioning System): Provides users with positioning and navigation information.

**Gradle**: Build automation tool for multi-language software development

**GUI (Graphical User Interface)**: The set of interactive visual components in software to improve the user experience.

**HTML** (**Hypertext Markup Language**): Standard markup language for documents designed to be displayed in a web browser

**iOS**: Mobile operating system developed by Apple

**JavaScript**: Object-oriented computer programming language commonly used to create interactive effects within web browsers

**Jsoup**: Open source Java library used mainly for extracting data from HTML

10

Kotlin: Object-oriented programming language initially designed for Android and Java Virtual

Machine (JVM)

Linux: Unix-like, open source operating system for computers, servers, mainframes, etc.

MySQL: A freely available open source relational database management system that uses

structured query language (SQL)

PHP (Hypertext Preprocessor): General-purpose scripting language suited to web development

RSS Feed (Really Simple Syndication Feed): Set of instructions on the computer server of a

Web site. The feed tells the reader when new material has been published on the Web site

**Scrum**: A process framework used to manage product development and other knowledge work

**Stakeholder (direct)**: Those involved in the company's day-to-day activities

**Stakeholder (indirect)**: Those more interested in the result of the production

**Twilio**: A developer platform for communications

UI / UX (User Interface/ User Experience): The graphical layout of an application which

includes components such as buttons, navigations bars, etc.

**Web Scraping**: Extracts and scrapes data from websites

**Web Server**: A computer that runs websites

**Windows**: Series of operating systems developed by Microsoft
